

(11)

$$\begin{array}{l|l} AB = 5 \times t & BC = 8 \times t \\ = 1000 \times \frac{3}{2} & = 1200 \times \frac{3}{2} \\ = 1500 \text{ km} & = 1800 \text{ km} \end{array}$$

In rt  $\Delta CBA$   
 $AC^2 = AB^2 + BC^2$  (Pyth. th.)  
 $= 1500^2 + 1800^2$   
 $= 2250000 + 3240000$   
 $= 5490000$

$$\begin{aligned} AC &= \sqrt{5490000} \\ &= 100 \sqrt{549} \\ &= 100 \times 3 \sqrt{61} \\ &= 300 \sqrt{61} \end{aligned}$$

$\therefore$  reqd. distance =  $300 \sqrt{61}$  km

(12)

$$\begin{aligned} CE &= CD - ED \\ &= 11 - 6 \\ &= 5 \text{ m} \end{aligned}$$

In rt  $\Delta AEC$   
 $AC^2 = AE^2 + EC^2$  (Pyth. th.)  
 $= 12^2 + 5^2$   
 $= 144 + 25$   
 $AC = \sqrt{169}$   
 $= 13$   $\therefore$  reqd dis = 13m

(13)

To prove  $AE^2 + BD^2 = AB^2 + DE^2$

Proof - In rt  $\Delta ACE$   
 $AE^2 = AC^2 + EC^2$  (Py. th.)  
 $\dots$  (1)

In rt  $\Delta BCD$   
 $BD^2 = BC^2 + CD^2$  (Py. th.)  
 $\dots$  (2)

(1) + (2)  
 $AE^2 + BD^2 = (AC^2 + BC^2) + (EC^2 + CD^2)$   
 $= AB^2 + ED^2$  [using Py. theorem in  $\Delta ACB, \Delta DCE$ ]

(14)

given - In fig  $DB = 3CD$

To prove  $2AB^2 = 2AC^2 + BC^2$

Proof - In rt  $\Delta ADB$

$$AB^2 = AD^2 + DB^2 \text{ (Pyth.)}$$

$$= AD^2 + (3CD)^2$$

$$= AD^2 + 9CD^2$$

$$= AD^2 + CD^2 + 8CD^2$$

$$AB^2 = AC^2 + 8 \times \left(\frac{BC}{4}\right)^2$$

$$\left. \begin{array}{l} BC = CD + BD \\ = CD + 3CD \\ = 4CD \end{array} \right\}$$

$$CD = \frac{BC}{4}$$

$$\left. \begin{array}{l} \text{or } AD^2 + CD^2 = AC^2 \text{ (Py. th.)} \end{array} \right\}$$

$$AB^2 = AC^2 + 8 \times \frac{BC^2}{16}$$

$$(x2) \quad 2AB^2 = 2AC^2 + BC^2$$
